

- **Determine what fw to use by reading the F/W Rev on the drive properties section at JungleFlasher.**
 - iXtreme Max Burner Tutorial – <http://bit.ly/p2em7z>
 - For slims: Make sure you have a dump from JF 1.87 or later from your original drive
 - Please make sure you're on **latest dash** and fw before running XGD3 games
 - XGD3 games (originals and back-ups) give E66 error with spoofed drives If you get update error ensure you are running stock fw before trying to update again (with the same update version) and you don't have a spoofed drive which in this case get a new drive as the original model.
 - Don't confuse 025 with 0225! The first are 02510C phat drives while the later are 0225 slim drives.
 - If loading pre-13146 fw on source JungleFlasher will autoload 1.1. This is completely normal. If you want to use your old files ensure that xbox is updated first, then manual load the 2.0 fw and press spoof source to target
 - ALL 02510C phat lite-on drives can **only** be dumped with MRA or PhatKey method. Any other drive can be dumped exactly as before.
 - When spoofing to LT fw it **IS** normal to say serial info not copied and ID strings not copied to target.
 - For the ones that want to flash their 74850C liteon drives to stock use the 1a000 file. Don't ask why, just do it.
 - Because Microsoft has enabled the write protect on 9504/0272 drives with the 13599 update, now ALL slim Lite-On drives are write-protected. The only methods to counter that are T-X pcbs, pro kits, sputnik360 and kamikaze. Proceed with caution.
 - The 13146 update, writes stock fw on all drives except Hitachi and already locked drives, all phat lite-on drives now become 02510C, 9504 become 0272, all benq drives become 04421C and Samsung are just patched.
 - 13146/13599 update can't retrieve your key if you don't have it on drive.
- ❖ REQUEST: We need any slim unmodified full dumps, If you can provide these please send to ofw4tj@gmail.com
